

Best Practice Table Washing Procedure

To clean a soiled surface...

- 1 Spray the table (or highchair tray) with a soap-water solution or other all purpose cleaner.
- 2 Wipe dry with a disposable paper towel or clean microfiber cloth.
- 3 Rinse the table/tray by spraying with water and then drying with a new paper towel or clean microfiber cloth.

To sanitize the eating surface...

- 1 Thoroughly spray the table/tray with an EPA-registered sanitizing solution and use according to manufacturer's instructions (*eg. how long the product needs to stay visibly wet on the surface and whether the product should be diluted or used as is*).
- 2 The surface cannot wiped immediately after being sprayed: Wipe the sanitizer off with the clean paper towel or microfiber cloth after an appropriate amount of time.
- 3 Rinse the surface if needed, *depending on manufacturer's instructions*.

SOME NOTES:

1. Use an EPA-registered sanitizer that is approved for use on food contact surfaces.
2. Sponges should not be used for sanitizing tables.
3. If using clean reusable cloths, microfiber cloths are recommended because they reduce the transfer of germs better than cotton.
4. If feeding chair trays are used as eating surfaces, the trays should be washed and sanitized in the same way as plates and other eating utensils.
5. If children rotate through snack, each place must be cleaned and sanitized between use by different children.
